

## How to grab IP address with PHP

Today I'll be showing you how to grab somebodies IP address when they visit a page.

The variable to use is `$_SERVER['REMOTE_ADDR']` - It's that simple. You can use it for just about anything, here are a few examples.

### Printing the Users IP Address:

```
<?php
print ($_SERVER['REMOTE_ADDR'], "I'm Watching You!");
?>
```

### Printing it to a File:

```
<?php
$ip = $_SERVER['REMOTE_ADDR'];
$handle = fopen('ipaddresses.txt', 'a+');
fwrite($handle, $ip); fwrite($handle, "\n");
fclose($handle);
?>
```

All you have to do, is to make a text file and insert any of these codes or one of your own and save it as `anythingyouwant.php`

Then upload it to your website and it'll do the trick :P

The Possibilities for what you can use this to are endless.

Good luck :D
